TITLE : METHOD FOR PROVIDING COLOR
 FASTNESS TO LIGHT TO COLOR
 IMAGE

II

V

III

ABSTRACT : PURPOSE: To obtain a light-fast magenta color image which does not fade even when exposed to light over a long time by incorporating a specified complex and a compound for promoting the prevention of fading due to light into a layer retaining a magenta color image formed by the reaction of an anilino type magenta coupler with the oxidized product of an aromatic primary amine as a color developing agent.

CONSTITUTION: A complex represented by formula I and a compound for promoting the prevention of fading due to light represented by formula II-V are incorporated into a layer retaining a nondiffusible magenta color image. The non- image part of a developed color photograph is extremely inhibited from being stained yellow. When color fastness to light is provided to a color image formed with a 3-anilino-5-pyrazolone type magenta coupler, by combining said complex with said org. compound, a synergistic effect is produced without exerting unfavorable influence on the photographic performance.
